

Vacuum testing

Do you use a tank bottom? Have you already had it inspected? Vinçotte conducts the necessary tests to ensure the sustainability of your tank bottoms.

Your tailor-made solution

The vacuum test is a relatively simple but extremely effective testing technique. This technique can be used among other things to inspect tank bottoms, in which a soap-like solution is poured on the tank floor, and using a box equipped with a sight glass at the top, vacuum is applied to create a vacuum zone. If there are any leaks in the bottom of the tank, air will be sucked into the soap-like liquid, thereby causing air bubbles in it.

This service offers you the following benefits:

- Simple technique
- Testing can be done quickly
- Very little preparation required
