

Calibration

The Calibration department has specialised in calibration for twenty years, mainly internal calibration. We do not sell equipment so we remain totally objective.

Our laboratory is offering you its calibration services (**electrical, pneumatic, thermal, ...**). In short, a professional quality service.

Your tailor-made solution

You can send or drop off your equipment to the Vinçotte des Isnes office. Another solution: a freight service (pick-up and return) is also possible.

Your result

A fast AND efficient solution: instruments are registered, tested and calibrated before being sent back to you within a week. So your equipment is out of action for a minimum of time.

As a Vinçotte customer, you are in direct contact with our metrologists. No middleman, just a skilled contact person committed to quality.

Please note

- The instruments are tested and calibrated in our laboratories.
- The certificate details the measurements' result.
- Each instrument receives a calibration label.
- Our standards are linked to national and/or international standards.
- The laboratory uses its own procedures or calibration methods.

In which situation?

This service is intended for industry, the steel industry, managers of power networks, any company needing to know the measuring quality of its equipment.

The aim is to measure the accuracy of your equipment. For a quality measurement.
